ever increasing population and demand of built up spaces have constrained our society to go for compact and multi storeyed building premises in metropolitan cities there was no choice for town planners but to go for vertical expansion rather than horizontal the net result was construction of thousands of multi storeyed complexes which needed proper fire security arrangements legislation exists at different levels incorporating different type of restrictions to the designers and occupiers of the building a vast amount of guidelines exists but not known to everybody engaged in the field this book is designed to cover this gap and will be a right choice in this direction it comprehensively deals not only with the fundamentals of fire

engineering appends different building bye laws and relevant abstracts from bis and national building codes nfpa lpa tac etc but reviews structural safety and provides sufficient multi disciplinary guidelines for selecting proper gadgets for complete fire safety of building complexes a complete treatise on fire security of its own kind for the first time in india

an improved version of woodward s chord plane aerodynamic panel method for subsonic and supersonic flow is developed for cambered wings exhibiting edge separated vortex flow including those with leading edge vortex flaps the exact relation between leading edge thrust and suction force in potential flow is derived instead of assuming the rotated suction force to be normal to wing surface at the leading edge new orientation for the rotated suction force is determined through consideration of the momentum principle the supersonic suction analogy method is improved by using an effective angle of attack defined through a semi empirical method comparisons of predicted results with available data in subsonic and supersonic flow are presented
