this volume focuses on a group of diverse developmental processes that have resisted incisive analysis when conventional genetic and biochemical methodologies were employed relatively little is known at the molecular level about these processes but the contributors have taken a firm stand by either presenting hypotheses or suggesting new ways to approach research problems in their fields the authors describe new models and hypotheses for such complex questions as embryos are biological clocks but how do they keep time oncogenes cause many tumors even though they are or are related to normal components of genomes what is their normal function morphogenesis is the acquisition or form by embryos and it is under strict genetic control nevertheless no gene product yet identified plays a direct role in these cellular movements why has it not been found molecular approaches to supracellular phenomena will interest students scholars and researchers in developmental biology

this book provides a solid conceptual framework and an introduction to the experimental nature of contemporary research
