an overview of statistical methods for analyzing data from fmri experiments functional magnetic resonance imaging fmri which allows researchers to observe neural activity in the human brain noninvasively has revolutionized the scientific study of the mind an fmri experiment produces massive amounts of highly complex data researchers face significant challenges in analyzing the data they collect this book offers an overview of the most widely used statistical methods of analyzing fmri data every step is covered from preprocessing to advanced methods for assessing functional connectivity the goal is not to describe which buttons to push in the popular software packages but to help readers understand the basic underlying logic the assumptions the strengths and weaknesses and the appropriateness of each method the book covers all of the important current topics in fmri data analysis including the relation of the fmri bold blood oxygen level dependent response to neural activation basic analyses done in virtually every fmri article preprocessing constructing statistical parametrical maps using the general linear model solving the multiple comparison problem and group analyses the most popular methods for assessing functional connectivity coherence analysis and granger causality two widely used multivariate approaches principal components analysis and independent component analysis and a brief survey of other current fmri methods the necessary mathematics is explained at a conceptual level but in enough detail to allow mathematically sophisticated readers to gain more than a purely conceptual understanding the book also includes short examples of matlab code that implement many of the methods described an appendix offers an introduction to basic matlab matrix algebra commands as well as a tutorial on matrix algebra a second appendix introduces multivariate probability distributions

evaluating statistical procedures through decision and game theory as first proposed by neyman and pearson and extended by wald is the goal of this problem oriented text in mathematical statistics first year graduate students in statistics and other students with a background in statistical theory and advanced calculus will find a rigorous thorough presentation of statistical decision theory treated as a special case of game theory the work of borel von neumann and morgenstern in game theory of prime importance to decision theory is covered in its relevant aspects reduction of games to normal forms the minimax theorem and the utility theorem with this

introduction blackwell and professor girshick look at values and optimal strategies in games general structure of statistical games utility and principles of choice classes of optimal strategies fixed sample size games with finite and with finite a sufficient statistics and the invariance principle sequential games bayes and minimax sequential procedures estimation and comparison of experiments a few topics not directly applicable to statistics such as perfect information theory are also discussed prerequisites for full understanding of the procedures in this book include knowledge of elementary analysis and some familiarity with matrices determinants and linear dependence for purposes of formal development only discrete distributions are used though continuous distributions are employed as illustrations the number and variety of problems presented will be welcomed by all students computer experts and others using statistics and game theory this comprehensive and sophisticated introduction remains one of the strongest and most useful approaches to a field which today touches areas as diverse as gambling and particle physics

it is a great book for a first year us graduate student one of the nice features of the book is that the book contains full solutions for all of the problems which make it useful as reference for self study or qualifying exam prep see full review maa reviews in this third volume of a course in analysis two topics indispensable for every mathematician are treated measure and integration theory and complex function theory in the first part measurable spaces and measure spaces are introduced and caratheodory's extension theorem is proved this is followed by the construction of the integral with respect to a measure in particular with respect to the lebesgue measure in the euclidean space the radon nikodym theorem and the transformation theorem are discussed and much care is taken to handle convergence theorems with applications as well as L^p spaces integration on product spaces and fubini's theorem is a further topic as is the discussion of the relation between the lebesgue integral and the riemann integral in addition to these standard topics we deal with the hausdorff measure convolutions of functions and measures including the friedrichs mollifier absolutely continuous functions and functions of bounded variation the fundamental theorem of calculus is revisited and we also look at sard's theorem or the riesz kolmogorov theorem on pre compact sets in L^p spaces the text can serve as a companion to lectures but it can also be used for self studying this volume includes more than 275 problems solved completely in detail which should help the student further
