this classic is one of the most cited and novel approaches to psychology ever written hans eysenck presents a descriptive and causal model of human personality in accord with the major concepts of experimental psychology and the physiological and

neurological mechanisms that form the biological basis of behavior patterns his proposal for an alliance between personality and physiology represented a major innovation in the field of psychology distinguished his research from his contemporaries and set the stage for a wealth of research to come before this foundational work eysenck had initially constructed a model of personality in such works as dimensions of personality and the experimental study of personality but these were primarily descriptive in nature a second phase of research included his dynamics of anxiety and hysteria and experiments with drugs where he provided causal analysis by reference to concepts then current in experimental psychology the biological basis of personality represents eysenck s third phase when he dug deeper to find biological causes underlying the psychological concepts of emotion excitation and inhibition which had formed the building blocks of his earlier efforts in this work the causal links he postulates between personality variables and neurological and physiological discoveries establish a realistic model that takes theory out of the field of mere speculation as sybil eysenck makes clear in her new preface this book paved the way for a marriage of the experimental and individual difference approach in personality psychology as sybil eysenck makes clear in her new preface this book paved the way for a marriage of the experimental and individual difference approach in personality psychology

differences between people are a fascinating and long standing area of psychological inquiry however previous research has largely been confined to studies at the descriptive level this book tries to explain individual difference rather than merely describe them explanations are derived from two major competing frameworks the biological and social approaches to individuality the book is based on the contributions of specialists from europe and north america invited to represent the biological and social points of view thus a direct confrontation is obtained of two approaches that hitherto have proceeded with virtually no reference to each other attention is paid to behavior genetics psychophysiology and temperament as well as to social learning behavioral strategies and person environment interactions differences and commonalities between the biological and social approaches are scrutinized and a common framework is outlined to stimulate future research due to its innovative character the book is particularly relevant for investigators in the field in addition it may be fruitfully used in advanced graduate level courses in personality psychology
